

Instructions:

Now it's time to put your tcpdump and command-line analysis skills to the test!

The SOC received an alert that an endpoint was exhibiting abnormal behavior as it triggered several detections, pointing to a potential info-stealer malware variant. As a SOC Analyst at Astley Financial, review the tcpdump_challenge.pcap packet capture and analyze its contents to complete the report below.

Challenge File:

02_Network_Security/01_tcpdump/Challenges/tcpdump_challenge.pcap

Q1 How many total packets are in the tcpdump_challenge.pcap packet capture?

1344

Q2 How many ICMP packets are in the challenge.pcap packet capture?

132

Q3 What is the ASN of the destination IP address that the endpoint was pinging?

13335

Q4 How many HTTP POST requests were made in the packet capture?

1

Q5 Look for any credentials within the payloads of any HTTP packets, what is the password you uncover?

ilovecats9102

Q6 Aside from HTTP on port 80, what is the other most frequent well-known destination port number?

ftp

Q7 What set of valid credentials did the endpoint use to access the file sharing server? (Format username:password)

demo:password

Q8 What is the name of the file that was retrieved from the file sharing server?

readme

Q9 Based on the unique User-Agent string found within the HTTP requests, what is the name of the related malware the endpoint might be infected with?

Lumma stealer

Q10 In defanged format, what was the full URL that the endpoint tried to connect to using the user agent identified above?

hxxps[:]//]t[.]me/+zz01921skaaa

Q11 [Bonus] - What is the full title of the YouTube video that the user requested?

Never Gonna Give You Up
